

ABSTRACT

A network dial-up servo system and method are used in Internet. The database of the network dial-up servo system stores the index of number type. These indexes are correspondent to the World Wide Web homepage data in the database. The users are connected to the network dial-up servo system by a phone dial-up operation. After the customer's computer is network-connected to the network dial-up servo system, the user inputs a number from the input universal resource location box in browser frame. By the services and operations of the network dial-up servo system, a complete contrast and a fuzzy contrast way is used to search for a network station homepage. The browser in the customer's computer may be connected to the World Wide Web homepage through this network dial-up servo system.
